Historical Overview

The present site of the City of Tulsa has been inhabited since the Creek Indians lived on the bank of the Arkansas River in the 1830's. But it was in August of 1882, when the St. Louis and San Francisco Railroad reached the north bank of the Arkansas River and Indian Territory, that the history of the urban city began.

The area surrounding Tulsa, once Indian Territory, was originally established to accommodate the relocation of tribes such as the Creeks, Seminoles, Cherokees, Quapaws, Senecas, and Shawnees. These Native American tribes moved into the region after the passage of the Indian Removal Act (1830), when they surrendered their lands east of the Mississippi to the federal government in exchange for land in Indian Territory. Each of the larger tribes was given extensive land holdings, individual governments were formed, and tribal members began new lives as farmers, trappers, and ranchers. However, this was not a permanent arrangement and throughout the mid-1800's the tribes were made to accept a number of treaties which continued to further limit the amount of land each of them held. White settlers continued to push forward, railroads moved into the territory, and in 1892 the land was officially opened and all tribal members were forced to accept individual allocations of land.

In 1902 the Missouri, Kansas, and Texas railway extended its line to Tulsa to serve the cattle business; the city's first industry. Ranchers and settlers, including Indians and whites, living within a one-hundred mile radius had been using Tulsa as a central trading point since the end of the Civil War. A stock yards, with cattle-loading pens and chutes, was built near the tracks, and cattle were driven from the Chickasaw Nation and the Seminole country to the Tulsa for shipment. Texas cattle were also shipped in to the area and later shipped out to the northern and eastern markets.

As the community grew, the citizens began to take an active interest in the direction of Tulsa, and the Tulsa Commercial Club, the forerunner of the Metropolitan Chamber of Commerce, was founded. This organization pressured the railroad to put Tulsa on their lines and was also responsible for the recruitment of many of Tulsa's early businesses. The city was incorporated in 1898 and two years later had a population of 1,390.

Tulsa changed from a cowtown to a boomtown with the discovery of oil in 1901 at Red Fork, a small community south of Tulsa. Wildcatters and investors flooded into the city and the town began to take shape. Many brought their families with them because Tulsa had the reputation of being one of the few "safe" frontier cities. Neighborhoods were established in Tulsa on the north side of the Arkansas River, away from the drilling sites, and began to spread out from downtown Tulsa in all directions. In 1904, Tulsans constructed a bridge across the river, allowing for oil field workers, supplies, food and equipment to cross the river, reaffirming Tulsa's position as the center of the oil field.

In 1905, the Glenn Pool oil field was discovered. This strike created such a large supply of crude oil it forced Tulsans to develop storage tanks for the excess oil and gas and, later, pipe lines. It also laid the foundation for Tulsa to become a leader in many of the businesses related to oil and gas, in addition to being the physical center of a growing petroleum industry. Eventually Glenn Pool established Oklahoma as one of the leading petroleum producing regions in the United States. Many early oil companies chose Tulsa for their home base and when a second surge of oil
discoveries came between 1915 and 1930, the city was well-established as the “Oil Capital of the Nation.”

Every type of transportation was represented during the early years of the city. The mud-filled streets of the oil boom days turned to brick as automobiles arrived in Tulsa. Electric trolleys followed the neighborhoods as they developed further and further from downtown, this service lasting until World War I.

The Tulsa economy was only slightly affected by World War I, and the 1920s were a period of extensive growth. Residential development continued in all directions. The lack of a good water supply, Tulsa’s greatest domestic problem, was solved when the Spavinaw Dam was constructed and water was pumped to Tulsa from a distance of 65 miles.

By the early 1920s aviation became an important part of the city’s economy. In 1919 the Curtis-Southwest Airplane Company was formed and in August of that same year they flew the nation’s first commercial interstate air freight shipment. By the end of the decade an international airport had been built and the Spartan Aircraft Company had been established.

In 1928 the Oklahoma City oil field was discovered and began to produce enormous quantities of oil. This field, combined with the plentiful supply of petroleum from eastern Oklahoma, overwhelmed the demand during the early years of the depression. The price of oil fell from its peak price of $3.50 in the early 1920s to ten cents a barrel. In 1931 the economic downturn of the nation was felt in Tulsa.

During the early 1930s growth in Tulsa, like many places across the United States, came to almost a complete halt. Few projects were built with the exception of public-works like the Twenty-First Street Bridge, built by the Works Progress Administration and completed in 1932. By the mid-1930s the construction business picked up and small houses were being built at the edge of the city limits. The streetcar lines were deserted and the automobile and the more convenient bus lines were used for transportation in the city. By 1936 the last streetcar was taken off the tracks.

When World War II broke out Tulsa’s oil industries, which had been in decline since the early 1930s, were converted to defense plants and the 1940s proved to be a period of growth for Tulsa. Many of the aviation industries also converted their factories to accommodate the war effort and defense workers poured into the city. As a result, a tremendous number of small houses, built to be purchased with Title 6 Federal Housing Administration loans, were constructed. Many of these houses were built in northeast Tulsa.

Redevelopment of the city began in the early years of the 1950’s. The growth of Tulsa to the south led to the construction of the Fifty-First Street Bridge, dedicated in 1953.

Infill and redevelopment, particularly in the downtown, continued throughout the 1960s. A number of early downtown commercial buildings were demolished to make way for modern high-rises. Residential properties were also targeted for demolition, and many north side homes were torn down to make room for new and better housing.

However, coinciding with the redevelopment of the city was the move of retail establishments to the outlying areas where residential neighborhoods were springing up. These new, suburban neighborhoods were primarily located in far south Tulsa.

The following decade of the 1970’s attempted to address the relocation of retail stores to the new malls in south Tulsa and the Main Mall, a pedestrian system in the core of the downtown, was
built. This development spurred the interest in renovation and reuse of older buildings, and the trend continued through the 1980’s. However, a slow economy held back many of the planned projects.

From the turn of the century until several years after World War II, urban Tulsa grew as the oil business flourished. The mansions on the hills of the Brady Heights Historic District reflect the first big oil boom, while the smaller, more modest residences throughout the rest of north Tulsa reflect housing built by the thousands of people who worked for the oil companies. In northeast Tulsa, rows of FHA housing, and later war-related housing, illustrate Tulsa’s ability to change with the times, from an oil capitol to a defense center.

North Tulsa serves to portray areas where people lived near the tracks in order to be close to work, middle class housing which was close to the growing aviation industry in northeast Tulsa, and the new era of housing which was a result of the depression and then World War II. Equally important as the unspoiled neighborhoods and oil mansions on the south side, the historic resources in north Tulsa are worth further study and recognition.
Ranching (1882 - 1901)

Tulsa was an important center for the cattle industry in the late nineteenth century. The first cattle were driven through Indian Territory in the mid-1860's from Texas to the railroad in Kansas. This route ultimately carried the cattle to eastern markets. This was at a time when Texas cattle were plentiful and there was a very strong demand for beef in the postwar East.

Ranching became big business in Indian Territory because there was no regulation of cattle-grazing on Indian and mixed-blood lands. The East Shawnee Cattle Trail brought wealth to Creeks and Cherokees through leasing arrangements, and the Five Civilized Tribes earned a considerable amount of income from leasing their land to white ranchers. Oklahoma was considered a prime ranching location because of the mild climate; cattle could survive the winters fairly well by eating dry grass and then fatten on the fresh grass of the spring.

Tulsa's significance as a focal point for cattle commerce arose when postal service commenced in 1879. Tulsa concomitantly became an entertainment center for cowboys. The cowboys primarily created their own entertainment by riding around town and making a lot of noise much to the chagrin of the local residents. However, it was the introduction of the railroad in 1882 that really marked the beginning of Tulsa's importance as a cattle market center. Early cattle trails were the routes preferred for the development of railroad lines. The first railroad line to reach Tulsa was the Frisco in August 1882, and the line was the deepest rail link into the territory of the Five Civilized Tribes for about two years. The line was ultimately extended to Red Fork, Sapulpa, Oklahoma City, and Texas.

The introduction of the railroad into Indian Territory was an important development not only for Tulsa but also for the consumer because it allowed ranchers to raise beef that first met market demands rather than beef that first met the rigorous demands of the trail. Cattle driven from Texas to Kansas had to be capable of walking and swimming long distances. Most of these trail cattle were longhorns and they generally had stringy meat which did not please the consumers of the eastern seaboard.

Tulsa's image as a cowtown lasted until 1901 when the city was overcome by the growth of the oil industry and the settlement of Indian lands by white settlers. In general, the Indians would have preferred a continuation of the leasing arrangements made with the ranchers because those arrangements provided income while the Indians were able to keep their land. Homesteading, on the other hand, resulted in the taking of Indian land for very little compensation. The Tulsa area was originally surveyed by J. Gus Patton and his brother, Dan. Surveying the area marked the prelude to white settlement and the demise of the cattle industry.

A Creek Indian, George Perryman, was an Indian cattleman whose ranch became the site of Tulsa. The Perryman Ranch was centered in South Tulsa and encompassed several thousand acres, although it did not incorporate any of the land in the current study area.

Property Type Analysis

Three property types are associated with the ranching context in Tulsa: log cabins, frame ranch houses, and stockyard structures.
Historic photographs of the period show primitive log cabins used by cowboys who raised cattle in the leased area of Indian Territory. The Melville B. Baird Ranch headquarters, a group of wooden frame buildings, was located in the vicinity of 4000 North Memorial Drive of Tulsa. Another North Tulsa ranch belonged to Cranc and Latimer. The two men leased 150,000 acres of land for cattle grazing from the Indians for three cents per acre. The house serving the ranch was built in 1883 half a mile north of Reservoir Hill. The house was a two-story buildings clad in vertically-placed wooden clapboards. 

The only other properties known to have existed that were directly related to ranching were the stockyard and the loading pens and chutes which were near the railroad tracks but they are no longer extant. No above-ground structures are left. It is possible that information pertaining to this period could be found through the use of archeological methods. Subsurface evidence of branding pens, drift fences, and possibly some ranch headquarters buildings may be extant.

To be eligible for the National Register of Historic Places, buildings and structures associated with ranching must possess integrity of design and materials. To be eligible for the National Register of Historic Places, archeological sites must be sufficient to yield the expected important information, if the appropriate study techniques are employed.

Property Listing

None of the known properties from this period remain.
Agriculture (1900 - 1940)

Agriculture did not play an important role in the history of early day Tulsa. However, a wide diversity of crops were produced in the Tulsa region, including tomatoes, watermelons, and onions. All large cash crops during the early twentieth century. The two most common crops in the Tulsa area in that time period were oats and corn. Cotton, a common Oklahoma crop, was raised in the area but was never a significant factor in the economy of Tulsa. When Tulsa developed as a major urban center in Oklahoma, the demand for dairy products within the area increased. Hence, Tulsa became a large producer of milk and eggs.

Tulsa lies at a crossroads where the predominating influence of several types of agriculture converge. Among those types are livestock ranging, dairy farming, poultry raising, cotton growing, and potato growing. Despite the presence of many types of agriculture, the Tulsa area was never the focus of any particular crop because the soils of the region are deficient in such major plant nutrients as phosphorous.

The introduction of the railroad in 1882 marked the beginning of Tulsa’s importance as a farm market center. The extension of the railroad into Indian Territory brought the opportunity for greater agricultural development because it became much easier to transport farm products to outside markets before they spoiled. The first railroad line to reach Tulsa was the Frisco in August 1882, and it was the deepest rail link into the territory of the Five Civilized Tribes for approximately two years. This line ultimately extended to Red Fork, Sapulpa, Oklahoma City, and Texas.

Tulsa’s strength in the economy of agricultural production has been the processing of food products rather than the initial cultivation of crops. A number of food processing activities have taken place in Tulsa since the 1910s, but it was in the 1920s that the diversity of Tulsa’s agricultural products peaked. Canned pork and beans in tomato sauce was just one new development of the decade which was being produced in Tulsa. By 1930, the value added to agricultural products by manufacture was greater in the area around Tulsa than the value of the district’s raw farm products.

The amount of land used in farming activity increased on a statewide basis during the first half of the century. In 1910, 65 percent of the total area of the state was used for farms. By 1925 that figure had risen to 70 percent and had risen to 79 percent by 1940. Tulsa County figures approximate those statewide figures. Nevertheless, most of those farms tended to be very small with over half of the farms around Tulsa occupying less than a quarter section each throughout the early twentieth century.

Cattle, while of modest importance in Tulsa County, has always been important to the state as a whole and the pastures of Osage County, just to the northwest of Tulsa, have been among the most productive.

In 1935 there were over three thousand farms in Tulsa County. Approximately two-thirds of those were operated by European American farmers. The other third were operated by African Americans, Oriental Americans, and Native Americans. However, the acreage controlled by the European Americans was sixteen times greater than that controlled by the combined total of the other racial and ethnic groups.
Property Type Analysis

Two property types are associated with the agriculture context in Tulsa: farmhouses and barns.

The number of farms in Tulsa County as late as 1930 implies that there were a number of farm dwellings and other farm-related structures surrounding Tulsa. Historic photographs show that typical farmhouses around Tulsa were made of wooden clapboards, generally had simple gable roofs, and were occasionally two stories in height. However, they did not appear to be constructed for longevity and none were found in the study area. Archeological evidence of the remains of other farm-related structures may exist and this possibility should be further pursued.

To be eligible for the National Register of Historic Places, buildings associated with agriculture must possess integrity of design and materials.

Property Listing

None of the known structures from this period remain.
Energy (1901 - 1945)

The petroleum industry played a major role in the history of the city of Tulsa. As early as 1889 oil and gas wells were drilled in northeastern Oklahoma. In 1901, the first major oil discovery near Tulsa occurred at Red Fork, a small farming community south of the Arkansas River. Glenn Pool, also within a short distance from Tulsa, was discovered in 1905 and produced such an abundance of oil that storage tanks and pipelines were quickly built to provide containment. These discoveries lured interested wildcatters, investors, and businessmen to Tulsa and, although other nearby cities vied for prominence, it became the "Oil Capitol of the World." By 1907 Oklahoma was the major petroleum producer in the South and Midwest.

The Cushing Field, located thirty-five southwest of Tulsa, was a major producer in the mid-1910's, peaking in April of 1915. In 1916, Charles Page developed the Sand Springs Pool. The Osage Nation, north of Tulsa, had been the site of oil exploration and production since the early 1890's but it was not until World War I and the development of the automobile that major production occurred. Known as the Burbank field, this discovery was producing over 4 million barrels in 1921 and peaked two years later with an annual production totaled 26,206,741 barrels of oil. By 1930, two thousand wells were in operation in the region surrounding Tulsa.

Surrounded by oil fields, early Tulsa citizens made a commitment to take advantage of the enormous financial potential of the industry. Every effort was made to promote their city over every other city in northeast Oklahoma. Although unusual, one of their most successful efforts included three booster trips across the Midwest and Northeast to entice businesses and families to move to Tulsa.

The same boosters also foresaw the need for a first-rate transportation center, and by 1905 Tulsa had four railroads: the Frisco Railway (1902), the Missouri Kansas and Texas Railway (1902), the Midland Valley Railway (1903), and the Santa Fe Railway (1905).

Tulsa's population quickly increased as newcomers came to Tulsa to make their fortunes in the surrounding oil fields; by 1907 the population was 7,298. Three years later, in 1910, the population of Tulsa had grown to over 18,000 and by 1920 it had quadrupled to 72,000. Ten years later, in 1930, the population again nearly doubled to 141,258.

Aggressive entrepreneurs such as Charles Page and Waite Phillips were examples of early Tulsa entreprenours determined to make Tulsa the "Oil Capital of the World." Charles Page is responsible for the development of Sand Springs, a small town west of Tulsa, where he began an orphanage and widow's colony in 1908 for children and wives of oil field workers killed in the oil fields. He also developed a number of industries in Sand Springs including a glass works, a zinc mill, a refinery, canneries, foundries, a cotton mill, and a steel plant. To provide access to Tulsa he built an interurban from the city to Sand Springs.

Waite Phillips affected Tulsa in a much more direct way. He was in Okmulgee County in 1915 for one of the big oil strikes and in 1924 sold the oil company he had built for five million dollars. He then organized a second company and within one year sold it for twenty-five million dollars. He built several downtown buildings including Philcade (NR 1986) and Philtower (NR 1979). His home, Philbrook (1978), is an Italian Renaissance Revival mansion with extensive gardens. He donated it to the city in 1938, and it was opened in the 1940's as a museum for the southwest and Native American culture.
Much of the built environment of Tulsa is a result of men such as Phillips and Page who made their fortunes in the booming oil fields surrounding Tulsa between 1900 and 1930. The 1920's reflect the extensive investment in real estate as a result of the oil industry.

**Property Type Analysis**

Drilling rigs, derricks, well sites, storage facilities, pipelines and pipeline stations, refineries and processing plants, power houses (central power), loading racks, petroleum production camps, company housing, company/corporate buildings, and homes associated with petroleum executives were identified as property types in the *Historic Context for Energy Development, Management Region #3, 1897 – 1930*. This report was submitted to the State Historic Preservation Office by George O. Carney, Project Director, in 1987.

Thirty-seven properties were identified in the 1987 report inside the city limits of Tulsa. Thirty-five of these properties are located in the Original Townsite, which is not included in the Study Area for this project. Two are outside the Original Townsite.

To be eligible for the National Register of Historic Places, drilling rigs, derricks, well sites, storage facilities, pipelines and pipeline stations, refineries and processing plants, central power houses, loading racks, petroleum production camps, company housing, company/corporate buildings, and homes associated with petroleum executives must possess integrity of design, materials, and setting.

**Property Listing**

No specific sites related to energy have yet been found in the study area.
Urban Development (1901 - 1945)

Urban development in Tulsa proceeded at a very slow pace before the discovery of oil in 1901 at Red Fork, a small community to the south of the city. Before wildcatters and entrepreneurs flooded into town, a few frame residential buildings and some sandstone and brick commercial buildings represented the town's progress. The city was surveyed in 1901 by J. Gus Patton and his brother, Dan, who used the northwest/southeast diagonal of the Frisco Railway tracks as a starting point. They named the roads west of and parallel to Main Street after western American cities and streets east of Main Street after eastern cities. Denver, Olympia, Santa Fe and Vancouver were some of the streets to the west; Boston, Cincinnati, Madison, Peoria and Yorktown were located east of Main Street.

The years following the discovery of oil were fast paced, and construction could be seen at every corner of town. For a period of almost fifteen years, the city never did look finished. Local regulations for sanitation, sewer and construction were passed soon after the turn of the century and by 1903 telephones had been established throughout the city. That same year an ordinance was also passed declaring sidewalks must be constructed of brick, asphalt, or cement. First and Second streets downtown were soon paved with brick, and it was not long before it was a battle between horses and cars for surface rights and speed limits.

Not only did the discovery of oil bring notoriety to Tulsa, but in 1901 a group of Tulsa businessmen formed the Tulsa Commercial Club. This group traveled around the entire nation relating the virtues of Tulsa and bringing national publicity to the city.

These efforts were successful: By 1904 Tulsa was suffering a housing shortage and the city limits were deemed to small. That same year North Tulsa, directly north of downtown Tulsa, was annexed. The population in Tulsa had grown from just over one thousand to 6,500 by 1905.

In 1907, the City of Tulsa was primarily contained within the boundaries of the railroads on the north and east, and by the Arkansas River on the west. The Missouri, Kansas and Texas Railway ran along the north side of town, parallel to the Frisco, several blocks to the south. Between these two sets of railroad tracks was the warehouse district. South of the Frisco Railroad tracks was downtown Tulsa. The original townsite was platted at right angles to both the M K and T and the Frisco; however, all subsequent plats were corrected to a north-south, east-west axis. The Santa Fe Railway also ran through Tulsa going north-south on the east side of the city, approximately one mile from the Arkansas River.

The Tulsa Streetcar Company laid its first tracks near First Street in 1907, and streetcar lines were established to the north, south, and to the west. The Lynch-Forsyth Addition was then opened on the east side in 1906 and several years later more lines were built to connect it to downtown Tulsa.

Tulsa was full of businesses including hotels such as the Arcade, the Eagle, the Frisco, the Alcorn, the Brady, the Frederick, the Marshal, the Midland, the Robinson, the Union, and New State. They were built to accommodate Tulsa's many visitors, many related to the oil businesses. Eight lumber companies were in operation in 1907. Tulsa also sported the Grand Opera House and the Rink Theater. Religious institutions included almost every denomination. Oil-related businesses were also abundant and included a tank shop, the Oil Well Supply Co., Oklahoma Iron Works, Waters-Pierce Oil Co., and National Supply Co. (oil well supplies). The Owen Face Brick Company was located directly north of the downtown.
In 1908 an engineer resurveyed the townsite for a new city charter, and an ordinance was passed declaring how the city was to be laid out and how streets were to be named and numbered. Some of the original names were changed.

Residential areas began branching out in all directions. By 1911 early neighborhoods extended to the northwest with Crosby Heights (1908) and Owen Addition (1906), and North Tulsa (1904), a part of the Brady Heights Historic District. To the east several neighborhoods were developing and "Central Park" was platted. To the south neighborhoods were prospering between 13th and 17th streets from Elmwood Avenue to Cincinnati Avenue. By the early teens the population of Tulsa was 20,000.

With a population of 35,000 in 1915, Tulsa continued to grow. The city had developed south to 21st Street between the Arkansas River and the Santa Fe railroad. This period is represented by the present-day Riverview Historic District (1907-1920). On the far east, a residential area was developing between Lewis and Harvard between First and Tenth. The proposed Owen Park Historic District had been developed by 1915, as well as others, including Irving, Brady Heights, Cherokee Heights and the area surrounding the Greenwood neighborhood. West Tulsa, on the west side of the Arkansas, had also begun developing and included the Moore Addition and the Riverside Addition.

Tulsa’s second period of growth occurred during the 1920’s when crude oil reached a peak price of $3.50 a barrel. More oil was discovered in the Tulsa area, some in the Osage Nation. A second building boom began and housing became scarce. All over the city additions were platted, houses built, and trolley lines laid.

In 1917 the first official airfield was opened by Tulsa oilman Harold Breene near what is now Admiral Place and Hudson. By 1919 the Curtiss-Southwest Airplane Company was formed; the nation’s first commercial interstate air freight shipping business. The company opened an airfield near what is now Apache and Memorial in 1921 and a second airport was built near Federal Drive and Sheridan. In 1926 the first Tulsa-built airplane was completed. Tulsans began promoting their city as a national air center and privately financed the purchase of an airport site, created runways, and built a temporary terminal administration building and passenger waiting room.

W. G. Skelly began Spartan Aircraft at approximately the same time, but its success was in the 1930s when it began producing C3-120s for flight training schools. During these years the airport relied primarily on air mail contracts. With the advent of World War II, Tulsans were given the opportunity to have a $15 million plant which would be operated by Douglas Aircraft company if they would furnish the land and the runways. A $750,000 bond issue passed and the city purchased 750 acres of land east of the existing airport. In 1947, Tulsa was twelfth in the nation in number of airplanes and fifth in the number of planes per capita. After the war was over the Douglas Aircraft plant stopped manufacturing army airplanes, however, it reopened in 1950.

In 1928, new oil fields in northeast Oklahoma and Texas continued to be discovered, including the the Oklahoma City Oil Field. As the price of oil dropped from $3.50 a barrel to ten cents a barrel, Tulsa suffered from the overproduction of the very product which built the city: oil.

By the mid-1930s New Deal programs, such as the Public Works Administration, were created to alleviate some of the housing shortages by providing monies for low-cost housing. In Tulsa, PWA allocated $2 million dollars to Tulsa for housing units which cost less than $2,500. This program was replaced by the Federal Housing Administration.
The oil industry continued to influence the development of Tulsa. Because of the easy adaptability of oil-related industries to war-related industries, the city was chosen as the site for a number of defense plants. The second largest government contract in the United States was awarded to Tulsa to construct prefabricated housing for use in Choteau, Oklahoma; Wichita, Kansas; and Little Rock, Arkansas.

**Property Type Analysis**

Urban development encompasses a wide variety of property types including residential, educational, religious, neighborhood commercial buildings, governmental, health care buildings, and landscapes.
Residential (1901-1945)

Overview of Residential Property Types

The north side of Tulsa is primarily made up of residential properties. They are generally simple one-story buildings although there are neighborhoods with two-and two-and-one-half-story houses. The vast majority were built as single-family houses, although there are some duplexes, rooming houses, and apartments.

The architectural styles found on the north side of Tulsa represent all of the styles popular during the first half of the twentieth century. Since the urban development of Tulsa did not begin until after the discovery of oil in 1901, there are very few styles popular before the turn of the century found in any Tulsa neighborhood. Some of the oldest residential buildings, however, are located in the study area. The late nineteenth and early twentieth-century styles represented include National Folk houses and Folk Victorian, Queen Anne, and Neoclassical Revival cottages. Styles popular during the first quarter of the century include Bungalow/Craftsman, the Prairie School, Colonial Revival, English Cottage/Tudor Revival, Italian Renaissance Revival, and Spanish Eclectic houses.

To be eligible for individual listing in the National Register of Historic Places, residences must possess integrity of design, materials, and location. Residential historic districts must have visually cohesive streetscapes with integrity of location, setting, association, and feeling, and each contributing building must retain architectural integrity.

National Folk Houses

National Folk houses spread across the nation along the path of the railroad and continue in popularity through the first half of the twentieth century. Historic photographs indicate that this style was very popular during Tulsa’s early development. This style is characterized by its lack of detailing and simple, overall design and construction. Many National Folk houses are one-story with a square mass and hipped roofs. The front is usually covered with a full-facade porch.

Shotgun Houses

Related to the gable-front family of the National Folk style houses is the shotgun house. The shotgun is a narrow gable-front dwelling that is one-room wide and several rooms deep. It has been traced back to similar forms in the West Indies, Africa and Haiti. This form of housing is found on the north side of Tulsa, particularly in the less desirable neighborhoods located near the railroad tracks.

Folk Victorian Houses

Few examples of the Folk Victorian house, popular between 1870 and 1910, are located in the study area. These houses are generally defined by the Victorian decorative detailings on simple frame houses. This detailing includes decorative wooden shingles, gingerbread woodwork, and turned porch columns. The one-story gable front-and-wing and the pyramidal house are the most common types and can be found in the Irving Historic District and the Brady Heights and Brady Heights II districts. Other examples can be found in some of the additions platted before 1910.
Queen Anne Houses

Popular between 1880 and 1910, typical, two-story examples of the Queen Anne house are difficult to find in the study area, as well as in other parts of the city of Tulsa. Characteristics of this style include an asymmetrical facade, a steeply pitched hipped roof with cross-gables, patterned shingles, bay windows, and a wrap-around porch.

A rare subtype, the one-story, patterned brick Queen Anne cottage, can be found scattered throughout the study area. Fewer than ten examples were located. They can be found in the Irving Historic District, Brady Heights II Historic District, and Area 8.

Neoclassical Revival Cottages

The Neoclassical Revival cottage, a subtype of the Neoclassical Revival style, can be found in many of the additions platted before 1910 on the north side of Tulsa. Characteristics of this style include a hipped roof with a central dormer, a colonnaded porch, and classic columns. Between 1900 and 1920 the style was particularly popular, and it is this period that is represented in the study area.

Bungalow/Craftsman Houses

The Bungalow/Craftsman style is the backbone of most of north Tulsa's neighborhoods. Popular between 1905 and 1930, this style was nationally fashionable as a middle-class, single-family dwelling. Most commonly interpreted in wood, the Bungalow had a low-pitched roof with wide, unenclosed eave overhangs. Exposed roof rafters and triangular knee brackets are present on most examples. A full- or partial-width porch supported by tapered square columns and brick or stucco piers is also a hallmark of the style. This style is present in almost every almost residential neighborhood in the study area.

Prairie School Houses

The Prairie School, one of the few American architectural styles, can be found in some of the additions platted prior to 1925. Generally two stories, examples of this style include a low-pitched, hipped roof, with widely overhanging boxed eaves and a one-story porch. A subtype, known as the American Foursquare or the Prairie Box, has a simple square or rectangular plan, low-pitched hipped roof, and symmetrical facade. This style is common to several of the Tulsa residential areas.

Colonial Revival Houses

The identifying features of the Colonial Revival style, popular from 1880 until 1955, include an accentuated front door, a symmetrical facade, and a side-gabled roof with dormers. This style is more commonly found in the Owen Park and Reservoir Hill districts. There are a few examples in the Cherokee Heights Historic District.

English Cottage/Tudor Revival Houses

The English Cottage or Tudor Revival style was very popular in the Midwest during the 1920s. Sometimes used by developers when building speculative housing, the proposed Oak Cliff Historic District is composed of almost 100 percent Tudor Revival houses. These houses are generally built of brick, although a few were frame with horizontal wood cladding. Typical characteristics of the style include steeply pitched, side-gabled roofs with one or more prominent,
steeply pitched cross-gables. Front-facing brick or brick-and-stone chimneys with chimney pots and arched porch entrances and doorways are also common.

**Italian Renaissance Revival House**

The Italian Renaissance Revival style of architecture was popular between 1890 and 1935. Features of this style include a low-pitched roof, wide overhanging boxed eaves with decorative brackets, and arched doorways or windows. This style is very uncommon on the north side of Tulsa, with the exception of the Owen Park and Reservoir Hill districts.

**Spanish Eclectic Houses**

The Spanish Eclectic style of architecture, popular between 1915 and 1940, freely borrowed elements of the Mission Revival and Spanish Colonial Revival styles. This style was particularly popular in the Reservoir Hill Historic District. Characteristics of this style include a low-pitched roof, a red tile roof, prominent arches above the main entrance or front-facing window, and a stuccoed exterior.

**Property Listing**

Only two houses located outside the designated historic districts have been determined to be potentially eligible for listing in the National Register of Historic Places.

751 East Pine Place
Craftsmen style

921 Troost Avenue
National style

**Neighborhood Commercial Buildings**

Several small individual commercial establishments, built to be used as grocery stores or grocery stores and living quarters, are located within some of the northside neighborhoods. In a few instances, there are clusters of stores. Most were built between 1920 and 1940. Typical of this type of property, a center entrance with display windows and clerestories form the front facade. When there is a second story, the upper floor windows are generally double-hung, wood windows. The exteriors are covered with brick or clapboards. Many of these properties are located in areas which have been designated historic districts potentially eligible for listing in the National Register of Historic Places and would be counted as resources.

Located along major streets and avenues are several strip shopping areas constructed between 1920 and 1940. These are generally one-story and constructed with brick exteriors, typical storefront facades, with simple brick cornices above.

To be eligible for listing in the National Register of Historic Places, neighborhood commercial establishments must possess integrity of design, materials, location, and association. Historic commercial districts must have visually cohesive streetscapes with integrity of location, setting, association, and feeling, and each contributing resource must retain architectural integrity.
Property Listings

Commercial establishments which may be potentially eligible for listing are located along Admiral Place in the Admiral Place Historic District.

1621 North Norfolk Avenue
False-front frame neighborhood building

Governmental Buildings

Government buildings include county and state office buildings, post offices, fire stations, and public water works. These buildings are generally located in the downtown area; however post offices and fire stations are scattered throughout the city. City water works are generally located near a source of water. In this case, the Tulsa City Water Works Building is located next to the Arkansas River. Many times these buildings are well constructed and are located on prominent streets and avenues, often on the corner of the block. A wide range of architectural styles may be used.

There are few post offices constructed before 1945 which were located outside the downtown area. Many times these substations were located in existing commercial buildings. Later, during the 1960s and 1970s as the city expanded and it was not possible for all citizens to access the downtown post office, larger substations were built. The common architectural style for such buildings was the International Style.

There is only one substation located in North Tulsa and it was built in the late 1950s or early 1960s and is located on Pine Street.

Early in the history of the city, fire stations were built outside the downtown area to accommodate the growing city. Early fire stations were built using the architectural characteristics common to early commercial buildings. Generally they were two stories in height, built with brick, and with one or two garage doors on the first floor and living quarters on the second. Later, the design of fire stations changed as the popular architectural styles of the day changed. During the 1930s many fire stations were built by the Works Progress Administration and were constructed of local materials, usually stone.

There are three fire stations located within the study area; however, one was built in 1990. Fire Station Number Two, located at 509 North Main Street, and Fire Station Number 16, located at 1401 North Lewis Avenue, were built in 1909 and circa 1935 respectively.

To be eligible for individual listing in the National Register of Historic Places, government buildings must possess integrity of design, materials, and location.

Property Listings

Fire Station Number Two
509 North Main

First Station Number Sixteen
1401 North Lewis Avenue

Tulsa City Water Works Building
Health Care Building
Health care facilities could include hospitals, clinics, sanitariums, and medical business/offices. Although the Tulsa's first hospital was located north of the downtown in North Tulsa, it is no longer extant. No other health facilities were located in the study area.

To be eligible for individual listing in the National Register of Historic Places, health care buildings must possess integrity of design, materials, and location.

Landscapes

Landscapes can include parks, plazas, gardens, unoccupied land, natural features, and possibly parking lots. Small neighborhood parks are scattered throughout the northside of Tulsa with one large park, Owen Park, located just northwest of the downtown.

Some of the neighborhood parks are located within potentially eligible historic districts and may be counted as contributing sites. Owen Park, one of the oldest and largest parks, is located within the boundaries of the proposed Owen Park Historic.

To be eligible for individual listing in the National Register of Historic Places, landscapes must possess integrity of design, materials, location, setting, feeling, and association.
Federal Housing Administration  
(1929 - 1945)

After the stock market crash of 1929, the construction industry came to almost an immediate halt and, if housing was available, it was almost impossible for the average home buyer to obtain a mortgage. For the next four years the amount of urban home foreclosures was enormous. During this period thirty-three states passed special laws for persons unable to pay their mortgage payments; some extended redemption periods, others provided for limited foreclosure. The most valuable laws passed were mortgage moratorium laws, which extended the time period before property could be foreclosed.

The earliest government involvement in the housing industry was a before and after World War I because of housing shortages and high rents. There was also a research program conducted by the Division of Building and Housing of the Department of Commerce during the twenties. These programs had only a small impact and it was not until the depression that the federal government was forced to interfere with private lending institutions in order to help the housing industry revive.

In 1932, the Federal Home Loan Bank System was established to help the flow of mortgage credit. However, this program was only the beginning of the relationship between housing and the government. The Federal Housing Administration, one of the most important programs created by the National Housing Act of 1934 developed as a solution to the immediate problem of the high costs of housing and the low availability of loans. Although the arguments placed before Congress stressed more immediate objectives, such as the revival of construction and the reduction of employment, it also served to fulfill a long range objective: the continued availability of decent and affordable housing.

The Federal Housing Administration (FHA) was originally designed to stimulate the production and installation of building materials and equipment. This federally-insured loan program required that the home buyer put a minimum 5 percent down; the government held the first mortgage. These mortgages were insured up to $16,000 or 80 percent of the property value. The original fund was $10 million, increasing to $35 million by June of 1941 through income from interest, fees, and insurance premiums.

The implementation of FHA loans lowered interest rates, extended amortization periods, improved methods of appraisal, advanced marketing knowledge, and aided technical research. Other, important contributions which came out of the FHA were the study of city planning and rehabilitation and improved standards of construction and land subdividing. Overall, the houses built during the late 1930s were better constructed and sounder mortgages were written.

After war was declared in December of 1941, the efforts of the nation were directed toward defense, and additional housing became necessary in areas where there were defense manufacturers and military installations. By December of 1942 approximately $2 billion in federal funds were made available to house war-industry workers. In addition, the FHA was also permitted to insure $800 million mortgages for war-related housing.

By fall of 1940, the Lanham Act had also been passed, which had an impact on urban housing. This act provided $150 million to provide housing for non-commissioned officers and civilian workers on naval and military reservations or in plants manufacturing articles of defense. The approximate cost of each housing unit was $3000. This low price was a result of prefabricated
units, light construction, simple materials and reduced standards.

Several years after the WW II began, materials were scarce, labor supply was reduced, and the maintenance of older, craftsman-like methods was not possible. Thus, the building industry was forced to respond to these limitations, resulting in increased efficiency in the design of housing, the types of materials used, and the building process itself.

During the 1940s many subdivisions were entirely constructed by developers as speculative housing. Title VI was added and provided builders and developers a 90 percent loan-to-value ratio, provided mortgages did not exceed amounts ranging from $4000 for a single-family house to $10,500 for a four-family unit. These amounts were later increased to $5,400 and $12,000, respectively. This allowed builders to obtain full mortgage financing without advance sales, to sell on a contract-for-deed with little or no down payment or, to hold dwellings for rent. As little as 5 percent of the total price of the house was necessary for a down payment if the builder remained on the note as a co-signer.

At the beginning of the defense program in 1940 it became evident that it would be necessary to provide additional housing for workers in war industries. By December 15, 1942, approximately $2 billion of federal funds was made available for these houses and in addition the FHA was permitted to insure $800 million in mortgages in war housing. Tulsa had several defense industries in the northeast part of the city and several additions were platted between 1940 and 1945. It is possible that some of this housing was built as a result of these programs.

After World War II the Veterans Housing Administration was created and veterans became immediately qualified for the government-insured loans. The periphery of the study area which was platted during the late 1940s in Tulsa reflects this period of post-war construction.

Other changes affected the way builders designed their new subdivisions. Not only housing, but the design of neighborhoods began to change. While older, typical subdivisions were a gridiron of streets formed of blocks measuring 600 by 250 feet, new additions diverted heavy traffic to just a few streets. Narrow interior streets were built, and the streets often conformed to the contours of the land. This allowed for a reduction in the costs of streets, preservation of the natural vegetation, and separation of local and through traffic. This was a response to an increased demand for attractively planned neighborhoods without traffic hazards.

From 1929 until after World War II, both houses and housing subdivisions quickly went through a series of tremendous changes, permanently altering the urban landscape of America. In Tulsa, the changing design of the additions could be seen on the city street map as the city expanded in all directions. In the northeast section of the study area, the additions platted after 1929 illustrate of these changes. Some of the additions can be identified by the pattern of the streets, designed in such a way to eliminate heavy traffic from passing through the neighborhood. The houses become smaller, the architectural features similar, and, in almost every instance, a one-car garage was incorporated. These changes were also in response to the decline of the city street car and bus systems and the growing dependence on the automobile for private transportation.

Property Type Analysis

To be eligible for listing in the National Register of Historic Places, residences associated with the Federal Housing Administration loan program, war-related housing, and housing built after World War II and insured by the Veterans Administration must possess integrity of design, materials, and location. Residential historic districts must have visually cohesive streetscapes with integrity of
location, setting, association, and feeling, and each contributing building must retain architectural integrity.

Minimal Traditional Houses

Between 1934, when the Federal Housing Administration was established, until the mid 1950s, when the Ranch style became popular, thousands of Minimal Traditional houses were constructed. These small 1,200 to 1,600 square-foot homes are located in the study area. The first to be built used features from the dominant Tudor Revival style of the 1920s, but the pitch of the roof was lower and the detailing simplified. The eaves are almost nonexistent. Others used detailing more common to Colonial Revival homes, again with simplifications. The main mass of the building was typically rectangular, with the fewest corners resulting in the lowest cost to build. Early examples of this style had detached housing, while later examples had the garages incorporated into the main mass. Generally, these early garages were for one car.

A great deal of this type of housing was found in the study area. In many of the areas which have been listed as nonhistoric, these houses were mixed with earlier housing from the teens and 1920s. These neighborhoods do not portray a sense of a particular time or a period of architecture. However, toward the east and northeast edges of the study area, entire neighborhoods of this type of housing appear.

Property Listing

The proposed Harvard Hills and Gary Place historic districts are excellent examples of this type of housing. Harvard Hills is located between Harvard and Knoxville, just north of Admiral Boulevard. Gary Place is located several blocks northwest of Harvard Hills. The design is typical of the period with an elementary school as a focal point of the area. The houses are medium-sized, brick residences with single or double incorporated garages.

Religion (1884-1945)

The Five Civilized Tribes, notably in the Cherokee and Creek settlements, organized churches. These were usually either Presbyterian, Methodist or Baptist churches served by a native pastor. Tulsa was no exception; the first organized church in Tulsa was the Presbyterian Church which was organized by the Creeks in 1883. The Methodist Episcopal Church, the forerunner to the First Methodist Episcopal Church, was organized in 1887 at Main Street and Cameron Street. Reverend George Mowbray was the first minister of the First Methodist Episcopal Church. The congregation later built a new building at Fifth Street and Boulder Avenue.

Other churches soon followed the establishment of the Presbyterian and Methodist churches. In 1890, the first Roman Catholic church was organized. Seven years later, the Baptists organized the first church of that denomination. Other early day churches built in Tulsa included the North Methodist Church which seated 300 people and the Methodist Church, South, whose building was described as “a fine, brick building with the largest audience room of any buildings in town, except for the opera house.”

Many of the early day schools were sponsored by churches. The first successful school in Tulsa, the Presbyterian Mission Day School, was taught under the auspices of the Presbyterian Church. The Methodist Episcopal Church operated a mission day school for children until 1899. The Holy Family Church and School under the Roman Catholic church was located at Third Street and Elgin
Avenue in 1911. A combination grade school and high school was later built under the auspices of the Holy Family Church in 1919 and 1920 under the direction of Monsignor John G. Herring.

Churches were established slowly during the early years of the nineteenth century. A total of eight churches were noted on the 1905 Sanborn Map; however, the only new church since the 1901 Sanborn Map was the Christian Church. By 1907, the African Methodist Episcopal Church at 305 North Greenwood Avenue was established to serve Tulsa’s black population. The Trinity Episcopal Church was established by 1907. By 1909, twelve churches were located in Tulsa. Seven additional churches, including two churches serving the black population, were noted on the 1911 Sanborn Map. The churches which were denoted as “Negro” were Brown’s Chapel, C.M.E. (Colored Methodist Episcopal) at 307 North Frankfort Avenue and the Tigert Memorial Methodist Church on North Main Street. Other churches established in Tulsa by 1911 included the Church of Christ, the First Baptist Church, the First Presbyterian Church, the Holy Family Roman Catholic Church, and the United Presbyterian Church.

Few permanent buildings were constructed for religious services until the 1910’s. The first congregation to erect a permanent building was that of the Catholics who built the Holy Family Church, at Ninth Street and Boulder Avenue. Construction on the church began in 1912. Services were held at the church in 1913 although the church was not completed and dedicated until 1914. The church was described as “cruciform in plan, pure and noble in design, its three heaven-pointing spires give a religious note to the city’s skyline.”

By 1915 almost every religion was represented in Tulsa, including two churches in the study area which served the black population of Tulsa. The two churches which served the black population were the Mount Zion Baptist Church at 415 North Elgin Avenue and the Vernon A.M.E. Church; both churches were denoted on the 1915 Sanborn map as “Negro”. Other churches once located within the study area and noted on early Sanborn Insurance maps included the Grace Methodist Episcopal Church, the Lutheran Church, Maconia Baptist Church, the Orcutt Memorial Methodist Church, the Pentecostal Church, and the Second Baptist Church.

Many of the early churches associated with the African-American culture in Tulsa were destroyed in the Tulsa Race Riot of 1921. Churches which suffered property damage in the riot include the Methodist Episcopal Church, the African Methodist Episcopal Church, the Colored Methodist Episcopal Church, Paradise Baptist Church, Metropolitan Baptist Church, Union Baptist Church and the Seventh Day Adventist Church.

The Mount Zion Baptist Church, the most well-known African-American religious institution in Tulsa, was completely destroyed in the riot. It had just finished building a new church in 1921, only to be destroyed six weeks later during the Tulsa Race Riot. The church was “designed to serve the North Tulsa black community.” It was organized in 1909 by S. Lyons who was the minister of the church for eight months. One of the ministers responsible for much of the growth of the church was Reverend R.A. Whitaker, an African-American. The church was rebuilt in 1921 after the race riots at a cost of construction $85,000. The congregation of the church repaid the $50,000 note twenty-one years later. The 1921 church building was rebuilt in 1945.

Property Type Analysis

Property types associated with religion are churches, church schools and parsonages. All of the early day frame buildings used as churches are no longer standing. They were replaced with buildings of a more permanent nature during periods of Tulsa’s rapid growth.
Churches

Although many frame churches were constructed during the early years of Tulsa’s development, congregations replaced them with more permanent buildings as soon as they could afford to rebuild. The majority of churches built on the north side of Tulsa before World War II are generally simplified version of the Gothic style. Some churches, however, were not formally designed and are simple, rectangular buildings with flat, hipped, or gable roofs.

During the 1940s a number of churches were built on the north side. These churches are medium-sized and designed in the Gothic tradition.

To be eligible for individual listing in the National Register of Historic Places churches must be architecturally significant or meet the criteria for exceptions. As an exception, they must possess historical significance beyond their function.

Church Schools

Early churches often had small schools associated with them. However, as public schools were built few religious schools remained.

To be eligible for individual listing in the National Register of Historic Places church schools must be architecturally significant or meet the criteria for exceptions. As an exception, they must possess historical significance beyond their function.

Parsonages

Many churches originally had associated parsonages. None were located during the survey.

To be eligible for individual listing in the National Register of Historic Places parsonages must be architecturally significant or meet the criteria for exceptions. As an exception, they must possess historical significance beyond their function.

Property Listings

While many religious buildings were located in the study area, few were found dating prior to the terminal date of 1945. Fewer were found to have been constructed prior to 1930. Many churches located north of Tulsa’s downtown were destroyed during the Tulsa Race Riot of 1921. Many of the congregations rebuilt their churches after the riot, some in the same locations, some in new locations.

The following is a list of the churches which were surveyed during the reconnaissance-level survey of Tulsa and found to be potentially eligible for listing on the National Register of Historic Places.

Vernon A.M.E. Church
Ca. 1913.
311 North Greenwood Avenue
Gothic Revival

St. Monica Catholic Church
Built 1936.
633 E. Marshall Place
Gothic Revival
Education (1880-1941)

The first schools in Tulsa were tribal schools for children of the Creek Indians, the original settlers of Tulsa. Later, mission day schools were established to teach children of the Creek Indians and settlers. Under the management of the Home Mission Board of the Presbyterian Church based in New York City, the first successful school in Tulsa, the Presbyterian Mission Day School, was started in 1885. This school, which has been called "the mother of public education in Tulsa," was built in 1884 at the corner of Fourth Street and Boston Avenue. Four years later, it was overcrowded; however, it continued to operate until 1899. The Presbyterian Mission Day School was razed in 1906, and its location became the site of Tulsa's first high school and grade school, Tulsa High School, which was built in 1906.

Another early church-operated school was built by the First Methodist Episcopal Church at the corner of North Main and Brady streets in 1888 and closed eleven years later in 1899. A third mission school operated under the auspices of the Methodist Episcopal Church, South, from 1895 until 1898.

Schools in early day Tulsa including the Methodist and Presbyterian day schools were based on the neighborhood or tribal school system of the Creeks. Under this system, each neighborhood was required to provide a school building. In turn, each neighborhood elected three local trustees for each school. This system of the Creeks was the forerunner of today's school districts and boards of education.

True public schools were not built in Tulsa until 1905. Ward School (demolished), the first public school was constructed in 1905. It was located between Fourth and Fifth Streets and between Cincinnati and Boston avenues. Northside School (demolished), built in 1905, was the second public school built in the city. It was located at 519 North Boston Avenue. Early day residents complained about the distance these schools were from the residential areas. Most of the school-age children lived north of the Frisco Railroad, yet schools were being built in the south part of Tulsa.

Schools listed in bold are located within the study area.

The period from 1906 to 1929 was a time of rapid growth and expansion of Tulsa's school system. In May of 1906, 1,792 students were enrolled in Tulsa's school system, and by the fall enrollment had grown by 544 students. Sequoyah School (an earlier school than the one which remains today) was built in 1906 at 516 North Boston Avenue. Lindsay Public School at 512 W. 12th was built in 1907; it was renamed Riverview Elementary School in 1917. In December of 1907, the control of the schools in Tulsa passed from the city to boards of education, organized by districts.

In 1908, the Lynch-Forsythe School at East First Street and Rockford Avenues and the Owen School (later Irving School) at 8 North Maybelle Avenue were built. The names of both schools
were changed in later years: Lynch-Forsythe was renamed Washington in 1914 and abandoned as a school in 1937; Owen School was renamed Irving in 1918. By 1909, there were eight public schools. In 1909, Lincoln School was built on the corner of 15th Street and Peoria Avenue in the Bellview Addition.

Schools were first constructed for the teaching of black students after Tulsa legally segregated education when Oklahoma became a state in 1907. One of the first schools built under this law was Dunbar Elementary School (an earlier school than the one which exists today) at Haskell Street which was built in 1909. Other schools built under this law were Bunche School at 2703 North Yorktown Place and Carver Junior High School at 624 East Oklahoma Place. The first available secondary education for blacks in Tulsa, Booker T. Washington Senior High School, at 1631 East Woodrow Place. The architect for Booker T. Washington Senior High School was Leon B. Senter.

As the population of Tulsa increased in the 1910’s, the city could not open schools fast enough to meet the growing demand for facilities. In 1909, Tulsa passed a $230,000 bond issue, of which $105,000 was reserved for existing facilities: Washington, Lincoln and Irving schools. The remainder of the bond money financed the construction of Celia Clinton (built in 1908 and demolished in 1952), Kendall (built 1912) at 715 South Columbia, Horace Mann (built 1913), and Oage (built 1913) at 325 W. Fairview (demolished). Riverview and Sequoyah schools were both built at 511 North Boston Avenue (both demolished). Lombard School was built in 1910.

Schools built in 1913 were Emerson at 311 West Fairview Street and the Conway Brown School at 1024 North Elwood Avenue at the northern entrance to The Tulsa Country Club. Also in 1913, the first black school was opened on North Hartford, consisting of an eight-room, brick building and a two-room frame building. Lowell Elementary and Junior High were opened at 621 North Peoria Avenue. Whittier Elementary School at 68 North Lewis Avenue was built in 1916.

In 1917, Tulsa citizens passed bonds to build eleven schools; each were far beyond the existing school districts. In 1918 two schools were constructed: Lee School at 1920 South Cincinnati Avenue and Pershing School at 1903 West Easton Street in the Owen Park neighborhood. To finance further growth, Tulsa’s first $1,000,000 bond proposal for education was passed in May 1919. Cherokee School at 6001 North Peoria Avenue opened in 1920.

Central High School, a Tudor-Gothic Revival building was built in 1917 on the corner of Sixth Street and Cincinnati Avenue. It was Tulsa’s only high school until the 1930’s, when Will Rogers High School at 3909 East 5th Place and Daniel Webster High School at 1919 West 40th Street were constructed. In 1976, the old Central High School was closed. The school was reopened at 3101 West Edison Street. The Public Service Company of Tulsa is now housed in the building once occupied by the old Central High School.

Kendall College became the first college in Tulsa in 1907. Originally, the college was the Presbyterian School for Indian Girls in Muskogee; the name and its mission were changed in 1907. The name of the college again changed in 1920 when it was renamed the University of Tulsa. The first building erected on the campus was Kendall Hall in 1908.

Some of Tulsa’s schools were built using the unit system, an innovative concept conceived by H.O. McClure, a member of Tulsa’s Board of Education. The first school built under the unit system was the Clinton Elementary School. Under the unit system, a block of land was purchased and a one-story building was erected along one side of a block. As more space was needed additional building units were added to the existing building. Eventually, a school would enclose a central playground. Other schools built according to the unit system were Dunbar, Emerson,
Lowell, Pershing and Whittier.

Property Type Analysis

Property types associated with education are mission schools, educational buildings and administrative buildings. None of the early day mission schools remain. Historic photographs and descriptions show them as typically built of clapboard materials. No one style can be said to dominate the schools that were built in the study area. Styles represented in the survey area include: Tudor Revival, Gothic Revival, Italian Renaissance Revival, Italianate, Art Deco, and Spanish Colonial Revival. Most of the schools in the study area were built between 1916 and 1929.

In order to be eligible for listing on the National Register of Historic Places, schools must possess integrity of design, materials, and location.

Property Listing

The early mission schools were razed to provide land on which to build the public schools. The oldest extant school is Irving School, built in 1909, though its use has been converted from education. Within the survey area, five schools were built between 1909 and 1919 and six schools were built between 1920 and 1930.

The following schools are located within a proposed historic district and would be considered contributing properties:

Oak Cliff Historic District

John J. Burroughs Elementary School.
1929 N. Cincinnati Ave.
Current use: Education
Architectural style: Tudor Revival

Burroughs Elementary School is significant as the only example of a Tudor Revival style school in Tulsa (North Tulsa). It also has a strong association with the Oak Cliff Historic District which is primarily a Tudor Revival style neighborhood.

Irving Historic District

Washington Irving School
Built 1909. Addition 1918.
8 North Maybelle Ave.
Current use: Vacant
Gothic Revival

Illustrates the unit plan.

Cherokee Heights Historic District

Grover Cleveland Junior High School
Built 1926.
724 N. Birmingham Ave.
Current use: Education
Italian Renaissance Revival

**Owen Park Historic District**

John J. Pershing Elementary School
1903 W. Easton St.
Current use: Vacant
Italianate

Illustrates the unit plan.

Roosevelt Elementary School
202 W. Easton Pl.
Current use: Education
Art Deco

**Harvard Hills Historic District**

Sequoyah Elementary School
Built circa 1935.
3441 E. Archer St.
Current use: Education
Spanish Colonial Revival

**Cherokee Heights Historic District**

Whittier Elementary School.
Built 1916.
68 N. Lewis Ave.
Current use: Education

Illustrates the unit plan.

The following schools are potentially eligible for either architecture and/or their association to a cultural community.

**George Washington Carver Junior High School.**
624 E. Oklahoma Place
Current use: Education
Gothic Revival

Potentially eligible for its association to the African American community.
Dunbar Elementary School.
East Pine St.
Current use: Vacant
Illustrates the unit plan.

Potentially eligible for its association to the African American community and for its design.

Lowell Junior High School.
Ca. 1914.
621 N. Peoria Ave.
Current use: Vacant
Illustrates the unit plan.

Springdale Elementary School.
Built 1926.
East Pine St.
Current use: Education
Colonial Revival

Potentially eligible as an outstanding example of a Colonial Revival styled school.
Transportation (1850s - 1945)

Travelers to early day Tulsa probably used some of Oklahoma's earliest transportation networks, the waterways and the trails. Keelboats and steamboats were also commonly employed during the trapping era (mid-1800's). The first steamboat on the Arkansas River went as far as Fort Smith, Arkansas, in 1822 and in 1828, steamboats were plying their way as far as Fort Gibson in Indian Territory.

The Santa Fe Trail and the Texas Road were some of the earliest trails through Indian Territory. The Texas Road was a north-south route from Missouri to Texas that was first used by settlers migrating to Texas. It later developed as a major cattle trail. Another important cattle trail was the East Shawnee Trail. It had a sizable impact on the range cattle industry of northeastern Oklahoma and brought wealth to the Creeks and Cherokees. Originating in Fort Smith, the California Trail also passed through Indian Territory and carried goldseekers to the west coast. The Osage Trace was used by Indians in the territory. It followed the Cimarron and Arkansas Rivers. A 65-mile long military road between Fort Smith and Fort Gibson later developed. The first commercial road was the Butterfield Overland Route which brought mail into and through the territory.

The post-Civil War Reconstruction Treaty of 1866 had a profound impact on the future development of urban areas in Indian Territory because railroads and white settlement were introduced. Focal points were created by rail service and cities grew along the routes. The Missouri, Kansas, and Texas Railway was the first railroad to enter Indian Territory in 1870. Its route approximated the Texas Road. The Santa Fe and the Atlantic and Pacific railroads soon followed suit by laying tracks into Indian Territory from Kansas. The Frisco line reached Tulsa in August of 1883 and marked the beginning of that city's rail service.

Numerous rail lines eventually converged on the central district of Tulsa. In 1902, the city convinced the Missouri, Kansas, and Texas railway line to go through Tulsa rather than follow a route seven miles to the east of Tulsa. The following year a strike on the Red Fork line prompted city leaders to seek the service of a third railroad as a form of security against the negative impacts that strikes cause. The Midland Valley Railroad was persuaded to bypass Sapulpa in favor of Tulsa and became Tulsa's third railroad. By September of 1905, the highly prestigious Santa Fe Railway had also established service in Tulsa because of the area's favorable economic outlook. The construction of the Santa Fe line in Tulsa coincided with the boom in the Oklahoma petroleum industry that saw Tulsa rise to global prominence in the energy field.

**Tulsa Trolleys**

An outgrowth of rail development was traction and trolley service. In July of 1907, with only a few paved roads within the city limits, trolley service began in Tulsa, and by the end of the year service was offered along Main, Third, and Fifth streets. The service primarily concentrated on downtown and the area south of downtown. The first company to institute trolley services was Tulsa Street Railway (TSR).

Two years later, in 1909, a charter was granted to the Oklahoma Union Traction Company (OUT), and the first trolley company to reach Owens Park on the west end of the city. The company linked the trolley line south to Orcutt Lake, now Swan Lake, at 18th Street and St. Louis Avenue. The route went through downtown Tulsa via Fourth Street, south along Elgin Avenue to Eleventh
Street, and then on to St. Louis Avenue. Although this area was already well-developed, no service from TSR had been located there.

TSR then developed a trolley line to Tulsa University on the east side of town. This line traveled east along First Street from Peoria Avenue to Lewis Avenue and then turned south to Seventh Street where it terminated at the university. Another line was developed on South Main from 13th to 17th streets and a line to Owens Park was constructed along West Third Street. Ultimately, OUIT built a line to Sapulpa. This 16-mile long line was completed in 1911. By 1915, several more routes in Tulsa were opened. The lines went north along Denver Avenue to Pine Avenue and southeast to Louisville Avenue and 21st Streets.

The trolley system continued to thrive through the early 1920's, but competition from jitney cars, taxis, and the private automobile cleared the way for decline. TSR was sold in 1929. OUIT went bankrupt in 1935 and was sold to a Minnesota group the following year for conversion to a fleet of privately-operated busses. However, bus service has operated publicly since the 1970's.

Roads and Highways

The survey and development of section roads set the framework Tulsa's street system. The grid of the central business district is oriented along an alignment imposed by the railroad, however, the major street pattern outside downtown was corrected to align with the cardinal directions of the compass.

The developing automobile industry had a very important impact on Tulsa. Not only did it affect the physical form of the city in the early twentieth century but the use of petroleum products concurrently fueled the growth of the city. Petroleum, a vital industry for Tulsa, was being used in the cars that were jamming the streets of the city and was increasingly being used in the surface treatments of the streets themselves.

The development of highway agencies in the 1910's would foreshadow the massive development of new road systems of the mid-twentieth century. The transportation networks and the petroleum industry were closely related. More roads were paved in northeastern Oklahoma than in any other part of the state by 1925.

By the 1970's, freeways were again changing the physical form of Tulsa. In several cases, new freeways such as US 75 followed old railroad alignments but many freeways such as the Osage Expressway did not. Some of those freeways carved significant areas out of established neighborhoods to accommodate their rights-of-way. Even many of the freeways that do follow railroad alignments have rights-of-way much wider than those of the preexisting railroads and therefore are often more intrusive than their railroad predecessors. Among the freeways that opened in the early seventies were I-244 and the Keystone Expressway (US 64). The Cherokee Expressway (US 75) opened circa 1980 and the Osage Expressway opened in 1989.

Property Type Analysis

Property types for transportation resources include trails, roads, river crossings, railroad depots, related structures and railroad bridges, and buildings related to early automobile service.

Evidence of early-day trails, roads, and river crossings was not located in the study area. There were no railroad depots located in the study area.
To be eligible for the National Register of Historic Places, railroad bridges, gas stations, and trolley tracks must exhibit integrity of design, materials, setting, and association.

**Railroad Bridges**

Railroad bridges were built in urban areas to facilitate automobile traffic through the city. These bridges were generally built after the city was developed and traffic had increased to the point where the train crossing were either hazardous or inconvenient. These bridges include concrete bridges built between 1920 and 1945.

There are also several railroad bridges located throughout the study area. However, the Frisco Railroad Bridge on Peoria Avenue was the only bridge surveyed.

**Gas Stations**

Gas stations, service stations, and automobile garages built during the first half of the twentieth century were generally one-story, brick, stone, or concrete buildings with gasoline pumps and/or a small garage. Most generally located at the corner of a block on busy thoroughfares, the buildings were often placed diagonally on the lot to for easy access to the pumps. This type of station or garage would often have a large canopy which extended from the building over the pumps for protection from the weather.

During the 1920s it became popular for large distributors, such as Texaco, Shell, and Phillips 66, to have professionally designed stations which would be used to both identify the company and also, for the architecture to fit into the surrounding neighborhoods.

Brick, cut stone, and concrete were used for many of the early stations which were inspired by the City Beautiful movement and designed with Greek, Beaux Arts, or Neoclassical detailing. However, during the early 1920s a little house by the side of the road was the most popular image used by the gas companies. Easy to build, most were rectangular buildings which mimicked Bungalows, English cottages, and in the South—Missions or Pueblo styled residences.

During the 1930s the filling station was redesigned using the International Style and the Streamline Modern. These buildings were generally covered with white, enameled-metal with large display windows, a small office, service bays, storage space, and restrooms—all under one roof.

Only one gas station, a Tudor Revival station built before 1940, was located in the study area, at 2007 N. Cincinnati Avenue. It continues to maintain its architectural integrity and is potentially individually eligible for listing in the National Register of Historic Places.

To be eligible for individual listing in the National Register of Historic Places, gas stations must maintain integrity of design, materials, and location.

**Trolley Lines**

A small percentage of Tulsa's trolley lines ran through the study area on the north side of Tulsa. One single line ran from downtown Tulsa northward along Main Street to Cameron Street and then west to Denver Avenue and north from there to Pine Street. The Owens Park, Irving, and Brady Heights historic districts, were all well-served in the early years of Tulsa streetcars. By the mid-1910's, lines were constructed to the south and southeast. The Sand Springs Railway originated in the Greenwood area, crossed downtown, then roughly followed the Arkansas River through Newblock Park and from there proceeded to Sand Springs. The streetcar line to Owens Park went
west along Archer Street and turned north on Rosedale Avenue to terminate at Easton Street. Another line traversed Nogales Avenue between Third Street and Archer Street.

There was no evidence of trolley lines, trolley stations, or trolleys found in the study area, however, it is possible that the original tracks are located beneath the existing road covering. Trolley lines would be eligible only if found above the ground.

**Property listing**

The Frisco Railroad Bridge on Peoria and the Tudor Revival filling station located at 2007 Cincinnati Avenue were the only properties associated with transportation which were surveyed within the study area.

The filling station appears to be potentially eligible for listing in the National Register of Historic Places. Before the eligibility of the bridge can be determined a complete survey of every railroad bridge in Tulsa must be conducted.
Industry (1900 - 1945)

Although Tulsa has been the location of a diverse group of industries, oil and gas have predominated since the Red Fork oil strike in 1901. Before the discovery of oil and gas, Tulsa's economy was tied to the cattle and cotton.

After oil was discovered and the population of Tulsa began to swell, a number of other early urban industries began including bakeries, flour and feed mills, saddlery and harness manufacturers, carriage and blacksmith shops, saw mills, bottling works, brick yards, ore mills, ice plants tailor shops, planing mills, boot and shoe shops, and cotton oil mills. Brooms, cigars, ice cream, dressed meat, tanks, tinware, and torpedoes were also produced.

Zinc and lead mines were located all around Tulsa. At the turn of the century, Collinsville—located in Tulsa County—boasted the single largest smelter in the world. This industry continued in northeastern Oklahoma until shortly after World War I, when strikes and the depletion of ore brought it to almost a complete halt.

After 1915 a number of other industries developed including an attempt to establish vineyards, a pork-and-beans plant, and the Claro-cola plant. The largest bread factory south of Kansas City, Midwest Bread Company, was located in Tulsa. The Purity Ice Cream plant was built in 1927 and produced 500,000 gallons of ice cream a year. The film industry came to Tulsa in 1918 and a number of Western movies were produced in the city. The automobile industry also tried its luck at manufacturing. "The Tulsa," an oil field car, and the "Tulsa 4," a family car, however, were short lived experiments.

An early interest in aviation helped Tulsa become a center for related industries. By 1919 McIntrye Airport was the second largest in the United States and a regular stop for transcontinental mail and military flights. This industry continued to develop, and in 1928, W. G. Skelly built the Spartan Aircraft Company, later a J. P. Getty enterprise.

The crash of 1929 did not affect Tulsa until 1931, and Tulsa continued to hold the title as the "Oil Capitol of the Nation." By the late 1930's Tulsa had diversified and industries including agricultural processing, textiles, and glass production had located in the city. However, oil continued to be the number one industry, with forty-four oil companies and 614 oil company offices located in the city.

The 1940's were a period of growth for Tulsa, both during and after the war. Aviation and the adaptability of oil-related industries to war industries made Tulsa the perfect location for defense plants. Many of the plants used for fabrication of close-tolerance oil equipment, easily adapted for war materials. Items such as propeller spinners, bombsight parts, winches used on landing crafts, bulldozers and trucks, 80 mm gun barrels, and all types of ammunition and weapons were manufactured in the city. Defense workers swarmed to Tulsa and war housing was built in the city, particularly in the northeast section.

After the war many of these same plants converted to peace time industries, including a trailer home manufacturer and a factory to rebuild military surplus vehicles for construction and petroleum applications. The construction industry continued to boom after World War II.
Property Type Analysis

Factory buildings, company housing, warehouses, mill complexes, quarries and salt works were identified as property types in a statewide report by George O. Carney in 1987. The only property type related to industry which was located within the study area and surveyed for this study was factory buildings.

Factory Buildings

Factory buildings constructed prior to 1945 were generally one-story buildings with high ceilings and large, multi-paned windows to allow for the greatest degree of natural light. Other characteristics of this property type include poured-concrete foundations, brick or structural tile exterior walls, metal casement windows, and metal roofs. The majority of the examples found within the study area are adjacent to one of the three railroad tracks.

To be eligible for the National Register of Historic Places, industrial sites must possess integrity of design, materials, location, and setting.

Property Listing

Industrial properties located in the Bethlehem Steel Company District and the Utica Industrial District may retain their architectural integrity. It was not possible to properly evaluate these sites because they are not accessible to the public. Only after a complete survey of each site is conducted should a final determination be made on eligibility.
African-American Settlement
(1836 - 1945)

African-Americans arrived in Tulsa with the Five Civilized Tribes in 1836. Members of the Five Civilized Tribes, particularly the mixed-blood members, often owned slaves. In the early 1900s, descendants of the Indian Territory slaves who were living in Tulsa were joined by African-American freedmen who had migrated from the south after the Civil War seeking a place in which to settle.

The African American emigrants from the South settled along First Street between Madison and Lansing avenues near the site of the old Midland Valley Depot, in an area which would later be known as Greenwood. The “Negro” section was confined to a section northeast of downtown Tulsa between the forks of the Midland Valley, Frisco, and Missouri, Kansas, and Texas railroad tracks.

In 1905, the city sold the area now known as Greenwood to various African-American inhabitants, and a strip of commercial buildings began to develop north along Greenwood Avenue. Some of the new residents in the Greenwood neighborhood opened commercial establishments. These included Owen W. Guilky, a grocery store owner, and Thomas Gentry, the first African-American in the real estate business in Tulsa. The Gentry family home was located on North Detroit Avenue.

By 1908, the commercial area known as Greenwood was established. Merchants in the area were men from such places as Arkansas, Minnesota, and Texas. Two blocks north of Greenwood was the Acme Brick Company. The close proximity of the brick plant resulted in the wide use of brick in building construction in the Greenwood area.

Another prominent business, the Daily Tulsa Star—“Negro” newspaper—was edited and published by Andrew J. Smitherman, an attorney. He established the Daily Tulsa Star in 1913 and continued to operate the newspaper until 1921 when the newspaper plant was destroyed in the riot. In 1921, Theodore Baughman started the Oklahoma Eagle after purchasing it from Smitherman. Baughman ran the newspaper until 1937 when Edward Lawrence Goodwin, Sr. purchased it. The Oklahoma Eagle plant was located at 122 North Greenwood, across the street from the site of the original newspaper, the Daily Tulsa Star.

In 1908, immediately after the incorporation of Tulsa, the new city charter enacted the first set of segregation or Jim Crow laws in the state of Oklahoma. The grandfather clause, which restricted some of the African-American population from voting and established segregated educational facilities, remained in effect until 1915, when it was declared unconstitutional by the United States Supreme Court.

On the early Sanborn maps, “Negro” dwellings were listed in the 500 block of North Frankfort in the Northside Addition which was platted in 1909. Established as a Negro residential area by a city ordinance, this area was completely settled with African-Americans from Lansing Avenue on the east to Boston Avenue on the west. Price Addition, platted in 1911 was primarily developed and settled by African-Americans. By 1911 an African-American church was located at Third Street and Greenwood Avenue and an African-American school has been established on the 300 block of Greenwood.
By 1915, an African American community was growing on the north side of Tulsa. Dunbar School, built in 1909, was originally located on Hartford Avenue between Cameron and Easton streets. It was denoted on the Sanborn maps as a "Negro" school, as was a public school near Greenwood, located in the Davis-Wilson Addition. The original Dunbar School burned down in 1921. Mt. Zion Baptist Church at 415 North Elgin Avenue in the Greenwood area was also denoted as "Negro."

At the time of the 1921 Race Riot, the Greenwood area boosted four drug stores, numerous grocery stores, two hotels, two shoe stores, a theater, physicians and dentists offices, beauty shops, barber shops, dressmaker shops, cafes, four upholstered jitney busses, and an undertaking concern.

In 1939, the new brick Dunbar Public School replaced the old Dunbar School, which had burned in the riot. It was moved to the southwest corner of Pine Street and Madison Avenue and was still designated as "Negro," as were Booker T. Washington School at 1631 East Woodrow Place, the George Washington Carver School at 624 East Oklahoma Place, and the St. Monica Roman Catholic School at 401 East Haskell. Other properties designated "Negro" on the 1939 Sanborn Maps include Mount Zion Baptist Church at 415 North Elgin Avenue, the Wesley Methodist Episcopal Church, the Church of God in Christ at 1253 North Greenwood Avenue, the Rose Hill Baptist Church, the Union Baptist Church at 1277 North Greenwood Avenue, and the St. Monica Roman Catholic Church at 401 East Haskell Street.

**Tulsa Race Riot of 1921**

In 1921 the National Guard was called out from Oklahoma City to aid in quelling the Tulsa Race Riot. Martial law was declared twenty-four hours after an initial incident and was lifted two days later.

Thirty to forty blocks of the African-American community in Tulsa were destroyed in the riot, including 1,115 residences. Three hundred and fourteen residences were looted. Many people perished; although the exact numbers will never be known, it was estimated that twenty-six African-Americans and ten whites died. Property losses were estimated to be $2.3 million. Almost 4,300 African-Americans were left homeless by the incident.

To house the homeless, detention camps were set up in community buildings and city parks. The Convention Hall at 105 East Brady Street, McNulty Park between Ninth and Tenth streets and between Detroit Avenue and Elgin Avenue, and the old fairgrounds east of Lewis Street and north of Frisco Avenue were used as sites for centers. The Convention Center housed 1,005 African-Americans and McNulty Park housed 4,000 African-Americans during the riot. These centers operated until June 15, 1921.

Mayor Evans, the mayor of Tulsa during the riot, required residents of the burned Greenwood area to report to Booker T. Washington Public School at 1631 East Woodrow Place for job assignments. The primary rooms (grades 1 - 6) of the school were converted into an emergency hospital. Central High School was used as the Red Cross headquarters during the riot, while the Methodist Church on Fifth Street was used as an emergency hospital. Reconstruction of the destroyed area was delayed when the city attempted to force the African-American community to rebuild further north rather on the same site that was destroyed. The Tulsa Executive Welfare Committee was established immediately after the riot with responsibilities for caring for the refugees and reconstructing the destroyed area.
Many homes and businesses succumbed to fire. The brick Mount Zion Baptist Church was only forty days old when it was totally destroyed in the riot. Another establishment destroyed in the fire was the Midway Hotel. Homes of many of the prominent residents of the area were destroyed in fires. A two-story brick house on Greenwood Street and the J.P. Hughes house at 623 Hill Street were both burned during the rioting.

Property Type Analysis

Property types associated with the settlement of African Americans in Tulsa are residences, commercial establishments, churches, lodges, and schools.

The redevelopment of the entire neighborhood traditionally associated with African Americans has been almost completely razed, and much of the land is either vacant or redeveloped. The entire commercial area, now known as Greenwood Street (outside the study area), was rebuilt after the riot.

To be eligible for listing on the National Register of Historic Places, properties associated with the African American community in Tulsa between 1900 and 1945 must retain integrity of design, materials, setting, and association.

Archeological Potential

Much of the residential neighborhood which was rebuilt after the Race Riot of 1921 has since been demolished in an effort to revitalize the area. Some of the housing has been replaced, while in some areas there are entire blocks which remain vacant. The areas which were burned in the Race Riot may be potentially eligible for listing in the National Register of Historic Places if archeological testing is conducted. This area is located directly north of the Greenwood Commercial District and has been designated the North Side Archeological Historic District. To be eligible for the National Register of Historic District, archeological sites must retain sufficient integrity to yield important information, if the appropriate study techniques are employed.

Property Listings

There were no neighborhoods, commercial establishments, or lodges within the study area which were determined to be eligible. Individual properties which were determined potentially eligible for their association with the African-American community are listed in the urban development and education contexts. They include the George Washington Carver Junior High School, the Dunbar Elementary School, and Lowell Junior High School. The churches identified as potentially eligible include the Vernon A.M.E. Church and the St. Monica Catholic Church.

The small number of potentially eligible buildings and structures are a result of the destruction caused during the Tulsa Race Riot of 1921, the subsequent redevelopment of the same neighborhood in the 1970s and 1980s, and few commercial establishments built by African-Americans within the black community. It is possible that an intensive survey of the area may result in adding additional properties to the list; for example, homes of significant African-American persons.
Native Americans (1836-1907)

Tulsa and the surrounding area was first settled by the Creek and Cherokee Tribes in 1836. The Creeks and Cherokees along with the Seminoles, Choctaws and Chickasaws (known as the Five Civilized Tribes) were forced to migrate west during the Indian Removal of 1836. The Creeks who settled the area in and around Tulsa were the Lochapokas band of the Creek Indian Tribe, who had made their home in Alabama prior to Removal. The Creeks settled the area primarily to the south and east of present-day Tulsa, with the Cherokees sharing the northern boundary of Creek land. To the west was the land of the Osages.

The boundaries of Tulsa were marked by the northern border of Creek tribal land and the southern border of Cherokee tribal land. Immediately adjacent on the western boundary of Tulsa was Osage tribal land. Originally, Tulsa was located one-and-one-half-miles from its current downtown area in Cherokee tribal lands. It was moved when white settlers arrived to settle Tulsa, because Creek law was more liberal than Cherokee law in allowing non-Indians into the tribal community. Prior to its incorporation, Tulsa was located in the Coweta District, the northeastern-most district of the Creek tribal lands.

Many of the first families in Tulsa were mixed-blood Creek Indians. One of the largest families was the George Perryman family. Other members of the Perryman family included Legus C. Perryman and Josiah Perryman, who along with their brother, George, each held the Creek office of Principal Chief of the Creek Nation at one time or another. George and Josiah Perryman are regarded as the founders and fathers of Tulsa. A descendant of the Perryman family, Lilah Lindsey, was the second teacher at the Presbyterian Mission Day School. She also has the distinction of being one of the first Creek women to earn a college degree.

Occupations represented in the Perryman family included merchants, ranchers, civic leaders, and postmen. The first post office (ca. 1880) in Tulsa was located on the Perryman ranch, or the "White House," as it was referred to by Tulsans. In 1879 it was located on what is now 36th Street and Trenton Avenue in the southern section of Tulsa. The Perryman Ranch was the largest in the area and spread from 21st to 71st streets and from the Arkansas River to Lynn Lane in Broken Arrow. Perryman later moved to a "fanciful two-story house with a cupola," which he built on "High Hill" in the block now occupied by the Tulsa County Courthouse in downtown Tulsa.

Most of the land in Tulsa was owned by just a few Creek families including the Perryman, Owen, Davis, Crowell and Childers families. The Ed Crowell farm was just east of Boston Avenue. Robert Childers, a Creek judge of the Coweta District, moved to Tulsa in 1882 and built one of the first new homes on Cheyenne Avenue between Archer and Brady streets. Jeff Archer, a mixed-blood Cherokee, built the first store in Tulsa. It was completed in December of 1882 and described as "a box shack twelve by fourteen feet in size, of rough lumber, with a tent roof."

The Bullete Addition was platted on the farm of George Bullette, a mixed-blood Delaware who arrived in Tulsa in 1882. Bullette was an early merchant in Tulsa who built a home on North Norfolk Avenue around 1894. South of Standpipe Hill, on the Cherokee side of the line, was a log house built by William Burgess, a Cherokee Indian. Chauncey Owen, a white man who married a Native American and lived on her allotment just west of downtown Tulsa, sold the city its first park—Owen Park. He arrived in Tulsa in 1874 and is also credited for building the first hotel in Tulsa.
The names of some of the streets and additions located in the study area are related to these Indian families, including Owens, Archer, Bullette, and Burgess.

**Property Type Analysis**

Properties which may be associated with the Native American culture include log cabins, farmhouses, residences, commercial establishments, and cemeteries. However, no properties have been found associated with Native American settlement in the study area. It is possible that some of these properties may be found during intensive surveys, particularly in the Cherokee Heights Historic District.

**Property Listings**

No properties associated with the Native American context were identified in the study area.
European Settlement (1900 - 1945)

When Oklahoma opened for settlement in the late nineteenth century, emigrants were moving to the United States to escape agricultural depressions in Europe. Many came to establish farms on the free land offered by the United States government. Some came to work in the oil fields and mines of northeastern Oklahoma. It was a common practice for companies to recruit ethnic Americans with experience working in the oil fields and mines, and on the railroads in other parts of the United States. Many of the ethnic groups were attracted to the area because of the zinc and lead smelting in northeastern Oklahoma, a business which needed great amounts of labor. In the urban areas immigrants and ethnic Americans often found opportunities as grocers, tailors, and dry good dealers.

The percentage of European immigrants and ethnic Americans settling in the Tulsa area at the turn of the century and for many years following was very small (2 percent in 1910). In Tulsa, before 1920, English, Irish, Germans, and Jews predominantly made up the ethnic population. The English, Irish, and Germans favored the petroleum industry; the Jews often had professional positions. The fast growth of Tulsa did not allow for ethnic groups to develop enclaves; rather, immigrants would settle near the downtown area and as the downtown expanded, their property was bought up and redeveloped for commercial uses. Groups of similar backgrounds dispersed throughout the city, rather than moving as a group to a new location. A Greek community began in Tulsa in the 1920s. Arriving primarily from Texas, the Greeks preferred city life and did settle together in a neighborhood. This neighborhood was demolished in the 1960s when the Broken Arrow Expressway was built.

Churches are often the only remaining properties associated with certain ethnic groups. The Catholic churches, with the exception of the African American Catholic church--St. Monica's--are located primarily on the south side of Tulsa, outside the study area. Synagogues, built by the Jewish who came in 1901 with the beginning of the oil boom, are also located south of the downtown and outside of the study area.

The Germans built the first Lutheran Church in 1914. They were forced to assimilate quickly after World War I began, and little evidence of their culture remains in Tulsa.

Property Type Analysis

Property types associated with ethnic Americans and immigrants include houses, fraternal organization buildings, ceremonial buildings, schools and commercial establishments. To be eligible for the National Register of Historic Places, buildings associated with European immigrants must possess integrity of design and materials. None of the known structures from this period remain.

Property Listing

None were located in the study area.
Bibliography
Bibliography

Brochure on current status of education in Tulsa.

A history of the northwest part of Tulsa in Osage County.

Gives in-depth history of early mass transportation systems in Oklahoma.

An account of the discovery of oil in Tulsa which led to the city's development into the focus of petroleum production for many years.

A broad, general history of Tulsa by one of Oklahoma's most renowned historians.

A general history of the of Tulsa.

History of the city of Tulsa.

A photograph collection of Tulsa.

A detailed account of one of the most important oil strikes in Oklahoma.

Booster publication with list of first. In depth exploration of early day personalities.

An account of the Tulsa Riot of 1921.

This history of the city's main airfield is important for exhibiting Tulsa's emergence as an aviation center.

Industrial and Railroad Map of Tulsa. Prepared under the direction of, and issued by industrial Department of Chamber of Commerce. Tulsa, 1935.

Map of industrial sites and railroads within the city of Tulsa.

An anecdotal history of Tulsa.

Brochure promoting early-day Tulsa.

A study of the social and economical conditions of the Negro population of Tulsa conducted for the Tulsa Council of Social Agencies by the National Urban League Community Relations Project.

Sanborn maps show existing buildings at the time each map was drawn.

This was a booklet describing the history of the Tulsa Public Schools. Dates of construction and etc. were thoroughly covered.

Parish, Mary E. Jones. Events of the Tulsa Disaster. Tulsa, 1922.

An examination of the Tulsa Race Riot of the previous year.

Many newspaper articles are included that focus on the cultural life of depression and World II-era Tulsa. There is an emphasis in this period on the change in Tulsa from a petroleum-based economy to one based on aviation.
Tulsa County Courthouse Records.

Plat information shows development periods of various neighborhoods of Tulsa.

Gives a description of Tulsa as it was before the oil boom and statehood.

A book that accounts the history of commercial Tulsa.

Traces Tulsa's history from the settlement of the Creek Indians, the importance of the cattle to Tulsa, and the impact of the oilers on Tulsa.
